

Guide to Using Anaconda and Git

To launch **Anaconda Navigator** and **Git**, open **AppsAnywhere** from the Start menu, search for "Anaconda" or "Git," and click to launch them.

Once Anaconda Navigator is running, open the **Start** menu, search for *Anaconda Prompt*, and select it. Similarly, search for *Git Bash* to open the Git terminal.

In **Git Bash**, clone the desired repository by running:

```
git clone https://github.com/iafarhan/langchain-playground
```

After cloning, navigate to the repository directory:

```
cd langchain-playground
```

In **Anaconda Prompt**, ensure you're in the project directory where the `requirements.txt` file is located, then install the required Python packages:

```
pip install -r requirements.txt
```

Important: Obtain your OpenAI API key from the [OpenAI Playground](#) and store it in the `.env` file for secure access.
